Job Market Paper

Subsidies and Housing Market Equilibrium

Abstract

I study downpayment subsidies, subsidized interest rates, and tax refunds for developers on the housing market in Colombia. These incentives apply only to housing units priced below an arbitrary cutoff. I use the cutoff as quasi-experimental variation to study the housing market response to these subsidies. Using administrative and census data, I show evidence of bunching at the cutoff. Households and developers buy and produce housing units up to 30 percent smaller to benefit from the policy. The subsidy doubled during the study period, and, as a result, the share of units sold at the price cutoff increased from 1 to 7 percent of the market share. To explain the observed equilibrium, I propose a housing market equilibrium model that allows product differentiation and heterogeneous developers and households. I use the behavioural responses induced by the subsidy to estimate the model primitives. I find that housing and consumption of other goods are gross complements, with an elasticity of substitution of 0.9. A counterfactual simulation shows that without the tax refund, developers may exit the market; their profits would be 14 percent lower.
